

theCompany

A consumer health care company with less than 50 employees specializes in providing custom technology to service physicians, caregivers, and the health care network. Client offers a proprietary Software as a Service (SaaS) product to their customers to assist in insurance and payment operations.

*Move fast. Build smart.
Run with confidence*

theChallenge

Initially, the company was facing an audit and needed a security review of their Azure environment. They required extra secure firewalls, anti-virus, and essential security services to meet HIPAA compliance. They additionally wanted to improve their deployment process which needed modernization. The company also lacked a dev environment that they could use for testing and deploying their code.

theSolution

The client invited Clear Measure as a trusted partner to provide the services needed for them to pass a security audit. Clear Measure was asked to create an Azure DevOps pipeline which was appropriate because they already had GitRepo and Azure. However, they were missing the connection between the two. A DevOps pipeline was implemented using Clear Measure's standard DevOps process and validated with the vendor to make sure that all the code was deployed correctly.

theBenefit

The deployment time was reduced by 96% from 300 minutes to 11 minutes per deployment. The dev environment that Clear Measure created allowed the client to deploy without risking their live environment. The security measures that were implemented significantly reduced risk to the client's systems.
